
Report for Item 3, 2026 S1

Student: Willow Woods, Y12

Course: Digital Technologies (Tertiary)

Unit: Introduction to Programming

Grade: B (Provisional*)

***Provisional grades are subject to faculty approval and may change.**

Knowledge and Understanding

You demonstrated a sound understanding of Flask routing, request-response concepts, HTML structure, CSS styling, JavaScript interactions, and website usability principles. You did create a Flask application with all required routes and demonstrated a clear understanding of how browser requests, route functions, template rendering, and returned responses work together within a web application. You also demonstrated strong understanding of semantic HTML elements, navigation systems, audience-focused content, page organisation, image accessibility, and responsive content structures. Your CSS work showed understanding of selectors, readability, style precedence, and how multiple styles interact to affect the same element. Your JavaScript work demonstrated understanding of dynamic page updates, user input processing, and how interaction can improve user engagement and accessibility. However, your understanding of form-processing concepts and website refinement principles was less developed. You did demonstrate strong knowledge of web-development concepts and explained how structure, styling, and interaction contribute to effective website functionality.

Skills

You demonstrated the ability to create effective website solutions using Flask, HTML, CSS, and JavaScript with control. You did develop a complete Flask application with working routes, create all required website pages, implement navigation systems, integrate audience-focused content, include appropriate imagery, and develop a structured stall-highlights section. Your work showed effective application of semantic HTML structures, page organisation, accessibility considerations, responsive layout concepts, CSS selectors, and dynamic page updates using JavaScript. You also demonstrated strong understanding of CSS style interactions and explained how styling behaviour affects website presentation. However, CSS theme consistency was not fully refined, the visitor-tip event listener was not successfully implemented, and the Flask form-processing feature was not developed. You

did create a high-quality website solution overall and demonstrated strong development skills, but greater precision is needed when implementing complete interactive features, form processing, and audience-focused refinements.
